Allowable Subject Matter

Claims 1 – 34 are allowed. The prior art of record fail to teach a multiple node network comprising, among other limitations, one of a plurality of terminal nodes *allocating an arbitrary network address upon receiving no allocated network address from a management node when the terminal node is attempting to join the network, wherein the terminal node determining that management node is faulty, the arbitrary network address being converted to a network address by the terminal node when no other terminal node has a network address identical to the arbitrary address or has been assigned the arbitrary address; a communication method between a plurality of nodes in a network comprising using the arbitrary network address as the network address for one terminal node if the arbitrary network address is not identical to a network address used by one of other terminal nodes; and a system in which each terminal node determines whether the management node has failed to assign the terminal node a network address and assigning itself a network address that is not currently used by any other terminal node active on the network.*

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Dawson (US 5,390,188) teaches method monitoring the performance within a ring communication network; Jinzaki (US 2002/0124060 A1) teaches retrieving a name of a communications node in a communication
